

PREVIEW

Manual of Poultry Diseases

This new edition focuses on the control of avian diseases. Several chapters on biosecurity, water hygiene, epidemiology, etc. have been added. The diagnosis being largely based on necropsy and histological examination, iconography was favored, with around 2700 figures. The last section of this manual refers to differential diagnosis tables allowing a reference to the chapter corresponding to each disease. This manual is the culmination of a long and fruitful collaboration with authors from all over the world whose list demonstrates the diversity of origins and especially their field of expertise. It is the French Association for the Advancement of Sciences (AFAS), created by Claude Bernard and recognized as being of public utility, which is the publisher.
