- Table of Contents
- Copyright
- List of contributors
- Preface
- **Chapter 1. Behavioral genetics and animal science**
- Abstract
- Introduction
- Genetics shapes behavior
- Genetic effects of domestication
- Basic genetic mechanisms
- Single-nucleotide polymorphisms
- Repeats
- Copy number variations
- Jumping genes
- Coding DNA
- Noncoding DNA, also called regulatory DNA
- Exome
- RNA transcriptome
- De novo mutations
- Quantitative trait loci
- Haplotypes
- Epigenetics
- Lamarckism
- Brain genetics more complex than other traits
- A brief historical review of animal behavior study
- Behaviorism
- Instincts versus learning
- Ethology
- Ethology and behaviorism provide tools to study emotions and behaviors
- Neuroscience and behavior
- Emotional systems motivate behavior
- Confusion of emotional systems may confound studies
- Genetics and emotional systems
- Interactions between genetics and experience
- Interactions between instinctual hard-wired behavior and experience
- The paradox of novelty
- Reaction to novelty
- Genetic factors and the need for novelty
- Temperament is not just about fear

- Species differences in emotional reactions to similar tests
- Biological basis of fear
- Fearfulness and the mothering instinct conflict
- Nervous system reactivity changed by the environment
- Taming does not change nervous system reactivity
- Domestic versus wild and fear responses
- Neoteny
- Overselection for specific traits
- Overselection in livestock
- Links between different traits
- Transgenic mice
- Random factors and noninherited effects on variation
- Concluding thoughts
- References
- Further reading
- **Chapter 2. Behavioral genetics and animal domestication**
- Abstract
- Definition of domestication
- The domesticated phenotype
- Evolutionary mechanisms in domestication
- Genetic mechanisms in domestication
- The role of hybridization in domestication
- Genetic architecture of domestication
- What types of mutations cause the domestic phenotype?
- Copy number variation
- Mapping genes for behavior—top-down approaches
- Mapping genes for behavior—bottom-up approaches
- Effects of specific mutations
- Epigenetics
- Closing remarks
- References
- **Chapter 3. How studying interactions between animal emotions, cognition, and personality can contribute to improve farm animal welfare**
- Abstract
- Preface to “How studying interactions between animal emotions, cognition, and personality can contribute to improve farm animal welfare” by Dr. Temple Grandin
- References
- Introduction
- Do animals feel emotions?
- Influence of cognitive processes on emotions

- Alteration of the judgment and decision-making by emotions
- Animal individuality in emotions: the concept of personality
- Individual variability in emotional behaviors
- Consistency of fear-related responses across different frightening situations
- Consistency of fear-related responses over time
- Personality as a complex intermediate variable
- Pre-existing characteristics of temperament
- A concept of positive welfare based on positive experiences
- Genetics and selective breeding for alleviating negative emotions
- Eliciting positive emotions by enriching the environment and management
- Environmental enrichment
- Positive human contact and training programs
- Cognitive enrichment: a new approach based on the animals' appraisal abilities
- Promoting positive experiences to mitigate negative experiences and to improve animal welfare and health
- Conclusion
- References
- **Chapter 4. Genetics and behavior during handling, restraint, and herding**
- Abstract
- Introduction
- Principles of herd behavior
- Visual and auditory senses
- Differences in the strength of herding behavior of cattle and sheep
- Social behavior and handling
- Flight zone
- Working the flight zone
- Measuring temperament in livestock
- Tests originally designed to measure fearfulness in cattle
- Tests that measure separation distress, fear, and seeking
- Other behavioral indicators which may indicate genetic differences in fear
- Effect of pig genetics on behavior during handling
- Lean, rapid-growing pigs are more excitable
- Behavior problems in crossbred beef cattle during the 1990s
- Animal size, body shape, coat color, and temperament
- Body type and temperament in domestic animals
- Type and temperament in wild herd animals
- Coat color and temperament
- Hair whorls
- Hair whorl height and vigilance

- The effects of early experience on handling
- Effects of environment and experience on pigs
- Excellent memory of aversive experiences
- Training highly reactive animals by introducing novelty gradually
- Innate nervous fearfulness or reaction to separation stress
- Facilitating animal movement in handling facilities
- Genetic effects on handling facility design
- Conclusion
- References
- Further Reading
- **Chapter 5. Reproductive and maternal behavior of livestock**
- Abstract
- General introduction
- Evolution and domestication
- Maternal behavior
- Selected areas of concern
- Conclusion
- References
- **Chapter 6. Factors influencing the expression of behavior in the domestic dog**
- Abstract
- Introduction
- Nature
- Nurture
- Conclusions
- References
- **Chapter 7. From mind to genome: the effect of domestication on dog cognition and genetics**
- Abstract
- Cognitively remarkable
- The domestication hypothesis
- Domesticated foxes
- Comparing wolves and dogs
- What genetic mechanism did evolution target?
- Different types of cognition?
- The opportunity to investigate the genetics of breed differences
- Heritable forms of cognition?
- Applications
- Conclusion
- Acknowledgments
- References

- **Chapter 8. Genetics of domesticated behavior in dogs and foxes**

- Abstract
- The dog is the first domesticated species
- Dogs are more competent than wolves in social interaction with humans
- Analysis of temperament traits in dogs
- The farm-fox experiment
- Selection of foxes for tame behavior
- Selection of foxes for aggressive behavior
- Behavioral and physiological changes associated with selection for tame behavior
- Genetics of fox behavior
- What the farm-fox experiment tells us about behavior
- Summary
- Acknowledgments
- References
- Further reading

- **Chapter 9. Behavioral genetics in pigs and relations to welfare**

- Abstract
- Introduction
- Pig behavior
- Farm Animal Welfare Council's five freedoms
- New phenotypes with new technologies
- Pig behavior and sustainable production
- Concluding remarks
- References

- **Chapter 10. Behavior genetics of the horse (*Equus caballus*)**

- Abstract
- Introduction
- Molecular behavior genetics
- Genetic differences interact with environment
- The effects of early experience on behavior
- Prenatal effects on behavior
- Early postnatal effects on behavior induced by handling
- Long-term effects of early intensive handling
- Early postnatal period
- Six months old
- Seven months old (weaning)
- One year old
- A nonintrusive neonatal handling method
- Factors affecting attachment to humans

- Mare behavior and human behavior influence foal behavior
- Serotonin genes and maternal behavior
- Training foals to accept handling
- Wearing a halter and hoof handling
- Subtle individual differences
- More factors that affecting bonding with humans
- Genetics and temperament: origins and outcomes
- Temperament tests
- The relationship between hair whorls and behavior
- Personal observations
- Hair whorls and side preferences
- Hair whorls, temperament, side preference, and environmental interactions
- The paradox of double hair whorls
- The hair whorls position is highly heritable
- Many traits are conserved
- A Predisposition to pathology?
- The science of hair whorls in humans
- Hair whorls in cattle
- Hair whorls in horses
- Increase of double whorls in racing and jumping horses
- Hair whorl height and reactivity in horses
- Lateralization in the nervous system
- Laterality in horses
- Motor asymmetry
- Sensory laterality
- Auditory and olfactory laterality
- Hemispheric dominance
- Hair whorl patterns and lateralization
- Chronic asymmetry
- Experience-dependent lateralized learning
- Switching sides
- Conclusion
- References
- Further reading
- **Chapter 11. Genetic selection of poultry to improve welfare**
- Abstract
- Preface to genetic selection of poultry for behavioral traits to improve welfare by Temple Grandin
- References
- Preface by the authors from the second edition
- Introduction
- Pharmacology

- Surgery
- Ontogeny
- Genetic selection
- Selection procedure
- Selection results
- Stability of the selection results
- Fear reactions
- Social behavior
- Stress reactions
- Neurobiology
- Conclusions
- References
- Additional reading studies published since the first edition
- **Chapter 12. Genetic influences on the behavior of chickens associated with welfare and productivity**
- Abstract
- Preface to genetic influences on the behavior of chickens associated with welfare and productivity by Temple Grandin
- References
- Introduction
- Assessment of welfare
- Criteria of welfare
- Physiological and immune responses
- Functional genomics
- Productivity
- Behavior
- General
- Domestication and behavior
- Genetic versus environmental influences
- Behavioral differences among populations
- Inbreeding depression and random genetic drift
- Mendelian traits
- Selection involving behavioral traits
- Broodiness
- Stereotyped pacing during the prelaying period
- Feather and cannibalistic pecking
- Agonistic behavior
- Mating behavior of males
- Appetite
- Walking problems and tibial dyschondroplasia
- Fear-associated behavior
- Open-field activity
- Tonic immobility

- Escape and avoidance (“flighty”) behavior
- Potential problems with selection on behavioral traits
- Selection involving production traits
- The environment of selection
- Multilevel selection
- Group selection experiments
- Conclusions from group-selection studies
- Multilevel selection experiments
- General conclusions
- References
- Further reading
- **Chapter 13. Genetics and animal welfare**
- Abstract
- Introduction
- Aggression in pigs
- Tail biting in pigs
- Savaging in sows
- Feather pecking in hens
- Effects of overselection in cattle and pigs
- Muscle growth and welfare
- Porcine stress syndrome and leg problems in pigs
- Problems caused by genetic selection for appetite
- Importance of roughage feeds
- Movement restriction versus feed restriction
- Nervous system abnormalities due to selective breeding for specific behaviors
- Inherited neurological defects
- Nervous defects in rodents and small mammals
- Depigmentation patterns and the nervous system
- Depigmentation, behavior, and defects
- Fluctuating asymmetry and genetic problems
- Welfare and genetic selection
- Transgenic animals used to study human neurological disorders
- Unexpected linked traits
- Speculations of genetic engineering
- Genetic diversity
- Ethical questions
- The farm versus the laboratory
- References
- Further reading
- Index
