

TABLE OF CONTENTS

Quantitative aspects of ruminant digestion and metabolism

2nd Edition

Introduction.

Rate and extent of digestion.

Digesta flow.

In vitro and *in situ* techniques for estimating digestibility.

Particle dynamics.

Volatile fatty acid production.

Nitrogen transactions in ruminants.

Rumen microorganisms and their interactions.

Microbial energetics.

Rumen function.

Glucose and short-chain fatty acid metabolism.

Metabolism of the portal-drained viscera and liver.

Fat metabolism and turnover.

Protein metabolism and turnover.

Interactions between protein and energy metabolism.

Calorimetry.

Metabolic regulation.

Mineral metabolism.

Growth.

Pregnancy and fetal metabolism.

Lactation: statistical and genetic aspects of simulating lactation data from individual cows using a dynamic, mechanistic model of dairy cow metabolism.

Mathematical modelling of wool growth at the cellular and whole animal level.

Voluntary feed intake and diet selection.

Feed processing: effects on nutrient degradation and digestibility.

Animal interactions with their environment: dairy cows in intensive systems.

Pasture characteristics and animal performance.

Integration of data in feed evaluation systems.
